The term cell growth is used in the contexts of biological cell development and cell division (reproduction). When used in the context of cell development, the term refers to increase in cytoplasmic and organelle volume (), as well as increase in genetic material following the replication during S phase. This is not to be confused with growth in the context of cell division, referred to as ...

The cell cycle, or cell-division cycle, is the series of events that take place in a cell leading to its division and duplication of its DNA (DNA replication) to produce two daughter cells. In bacteria, which lack a cell nucleus, the cell cycle is divided into the B, C, and D periods. The B period extends from the end of cell division to the beginning of DNA replication.

The somatotrophic axis, consisting of growth hormone (GH), hepatic insulin-like growth factor I (IGF-I), and assorted releasing factors, regulates growth and body composition. Axiomatically, since optimal body composition enhances reproductive function, general somatic actions of GH modulate reproductive function. A growing body of evidence supports the hypothesis that GH also modulates ...

Interspecies blastocyst complementation enables organ-specific enrichment of xenogenic pluripotent stem cell (PSC) derivatives. Here, we establish a versatile blastocyst complementation platform based on CRISPR-Cas9-mediated zygote genome editing and show enrichment of rat PSC-derivatives in several tissues of gene-edited organogenesis-disabled mice.

), suggesting that RRRs are conserved among mammalian species. In this study, we applied both histone demethylase Kdm4d mRNA and histone deacetylase inhibitor trichostatin A (TSA) to the cloning of macaque monkeys. We performed SCNT using both fetal monkey fibroblasts and adult monkey cumulus cells and successfully produced live birth of monkey offspring carrying nuclear DNA of the donor cell ...

CELL CYCLE AND CELL DIVISION 163 10.1.1 Phases of Cell Cycle A typical eukaryotic cell cycle is illustrated by human cells in culture. These cells divide once in approximately every 24 hours (Figure 10.1).

Conclusions. We have defined a gut-brain axis that regulates glucose metabolism mediated by antagonistic fibroblast growth factors. From the intestine, bile acids stimulate FGF15 secretion, leading to activation of the FGF receptors in hypothalamic AGRP/NPY neurons.
