A polymer (/ ˈ p ɛ ɪ m ɛ ɪ m r /; Greek poly-, "many" + -mer, "part") is a large molecule, or macromolecule, composed of many repeated subunits. Due to their broad range of properties, both synthetic and natural polymers play essential and ubiquitous roles in everyday life. Polymers range from familiar synthetic plastics such as polystyrene to natural biopolymers such as DNA and proteins that ...

Carbon nanotubes have long been recognized as the stiffest and strongest man-made material known to date. In addition, their high electrical conductivity has roused interest in the area of electrical appliances and communication related applications.

### **Carbon nanotube“polymer composites: Chemistry, processing**

This free course, Introduction to polymers, examines the use of polymers and demonstrates how their properties are controlled by their molecular structure.

### **Introduction to polymers - OpenLearn - Open University**

This is a list of important publications in chemistry, organized by field.. Some factors that correlate with publication notability include: Topic creator “ A publication that created a new topic.; Breakthrough “ A publication that changed scientific knowledge significantly.; Influence “ A publication which has significantly influenced the world or has had a massive impact on the ...

The Basics of Plastic Manufacturing. The term "plastics" includes materials composed of various elements such as carbon, hydrogen, oxygen, nitrogen, chlorine, and sulfur.

## **How Plastics Are Made**

Going for gold: The mono- and di-chloroform solvates of  $[Au_2(\mu_2-1,2-bis(diphenylarsino)ethane)_2](AsF_6)_2$  undergo single-crystal-to-single-crystal transformations that result in gain or loss of only one chloroform molecule and changes in the structure and luminescence of the digold cation.
