A unit circle $\hat{=}$ has a circular sector with an area half of the circular angle in radians. Analogously, a unit hyperbola $\hat{=}$ has a hyperbolic sector with an area half of the hyperbolic angle.. There is also a projective resolution between circular and hyperbolic cases: both curves are conic sections, and hence are treated as projective ranges in projective geometry.

In mathematics, the polar coordinate system is a two-dimensional coordinate system in which each point on a plane is determined by a distance from a reference point and an angle from a reference direction.. The reference point (analogous to the origin of a Cartesian coordinate system) is called the pole, and the ray from the pole in the reference direction is the polar axis.
