considerable decrease in amplitude of foundation vibrations. Keywords-Embedment, sliding, rocking, yawing, resonance. I. INTRODUCTION The analysis and design of machine foundation requires more attention since it involves not only the static loads but also the dynamic loads caused by the working of the machine.

The turbine-generator foundation (TGF) is a complex engineering structure. Different types of foundations are used for different machines depending on their capacity, geometrical sizes and constructional features. Base Mat Foundation, the simplest type of the TGF, consists of reinforced concrete plate 1.2 to 1.7 m thick.

DYNAMIC ANALYSIS AND STRUCTURAL DESIGN OF TURBINE

Assessment of the foundation's natural frequencies, damping characteristics, and potential resonance conditions, as well as the impact of vibration and dynamic stress. Field measurements taken for existing foundations, to help define soil properties to insert appropriately into our models.

dynamic response of foundations (Bhatia, 2006). Based on the scientific investigations carried out in the last few decades it has been established that it is not enough to base the design only on the vertical loads multiplied by a dynamic factor, even if this factor introduces a dynamic load many times greater than the original one.

This paper treats this case, providing foundations for dynamic group signatures, in the form of a model,

strong formal definitions of security, and a construction proven secure under general assumptions.
