Euler's Phi Function An arithmetic function is any function defined on the set of positive integers. Definition. An arithmetic function f is called multiplicative if $f(mn) = f(m)f(n)$ whenever m, n are relatively prime. Theorem. If f is a multiplicative function and if $n = p_1^{a_1} p_2^{a_2} \dots p_s^{a_s}$ is its prime-power factorization, then $f(n) = f(p_1^{a_1})f(p_2^{a_2}) \dots f(p_s^{a_s})$. Proof.

The Euler Phi Function An arithmetic function takes positive integers as inputs and produces real or complex numbers as outputs. If f is an arithmetic function, the divisor sum $Df(n)$ is the sum of the values of f at the positive divisors of n .

EULER'S FORMULA FOR COMPLEX EXPONENTIALS According to Euler, we should regard the complex exponential e^{it} as related to the trigonometric functions $\cos(t)$ and $\sin(t)$ via the following inspired definition: $e^{it} = \cos t + i \sin t$ where as usual in complex numbers $i^2 = -1$: (1) The justification of this notation is based on the formal derivative of both sides,

EULER'S FORMULA FOR COMPLEX EXPONENTIALS

A totient number is a value of Euler's totient function: that is, an m for which there is at least one n for which $\phi(n) = m$. The valency or multiplicity of a totient number m is the number of solutions to this equation. A nontotient is a natural number which is not a totient number. Every odd integer exceeding 1 is trivially a nontotient.

Math 259: Introduction to Analytic Number Theory

Euler used infinite series to establish and exploit some remarkable connections between analysis and number theory. Many talented mathematicians before Euler had failed to discover the value of the sum of the reciprocals of the squares: $1^{-2} + 2^{-2} + 3^{-2} + \dots$.
